1 Overview

VFSJFileChooser is a Java Swing Component which allows you to browse both remote(FTP, SFTP, WEBDAV, etc.) and local filesystems. It is based on Apache Commons VFS library. VFSJFileChooser is distributed under [Apache License 2.0](#).

VFSJFileChooser was first started to be a plugin of [XPontus XML Editor](#). Later, it was decided to create a library which wouldn't be tied to XPontus API.

VFSJFileChooser supports all the file systems [available in Commons VFS](#).

You can think of VFSJFileChooser as a *javax.swing.JFileChooser* with the ability to browse remote locations such as FTP, SFTP, etc. VFSJFileChooser has not been designed as a file transfer tool, however it can be easily implemented (2 VFSJFileChooser components and some buttons calling commons-vfs API methods, a queue for file operations, etc.).

Please see the [features](#) , the [screenshots](#) and the [tutorial](#) for more details.

Note:

The new API now uses Enum instead of int fields which breaks the compatibility with previous versions(setFileSelectionMode, showOpenDialog, showSaveDialog).

VFSJFileChooser icons are from [FamFamFam](#) and [Tango](#).
